**Question 1:** Write a Java program that simulates the training process of a Pokémon. Initially, the Pokémon will take an energy level from the user which should be greater than 50, and training points will be zero. The program will iterate through a series of training sessions. In each iteration, the Pokémon gains 10 training points while simultaneously losing 5 energy points, making sure that the energy level does not fall below 50. The initial energy level and training points will be printed along with the progress of each training session, including the training points earned and the current energy level. The training sessions continue until the Pokémon's energy level drops to 50 or losing 5 more energy points will decrease the energy level below 50, signifying exhaustion, at which point the loop terminates with the message "Pokemon is exhausted. Training terminated.".
